

Scrub, Heathland and Coastal Complexes

SLG *Leptospermum glaucescens* heathland and scrub: scrub facies

Community Description:

This mapping unit occurs on skeletal or infertile soils and is almost always dominated by *Leptospermum glaucescens* with *L. scoparium* and/or *Banksia marginata* often co- or sub-dominant. The scrub facies is dominated by a dense layer of trees 2 to 5 m in height. This benchmark is most appropriately applied to the mature end of the community's successional development, where closed scrub communities have a poorly developed understorey often confined to a few straggling woody species.

Benchmarks:

Component	Cover %	LF Code
Dominant Life Form	60%	T
Organic Litter	30%	

Expected Life Forms	LF code	# Spp	Cover %
Tree or Large shrub	T	4	60
Shrub	S	4	20
Herbs and Orchids	H	2	1
Medium to small sedge/rush/sagg/lily	MSR	3	10
Ground fern	GF	1	1
Mosses and Lichens	ML	1	5
Total	6	15
