The map is based on data collected during the Tasmanian Reconnaissance Soil Survey as well as on data collected during the 1940-1950 national surveys and generally on soils developed on Jurassic dolerite and sandstone bedrock and colluvium on undulating to rolling (3-32%) land. Rock outcrop is frequent on dolerite slopes. Podzolic soils on Jurassic dolerite bedrock and colluvium on undulating to steep (10-56%) land result from gentle undulating to rolling (3-32%) dolerite, sandstone and mudstone hillslopes.

Land. Rock outcrop is frequent on dolerite slopes. Podzolic soils on Jurassic dolerite bedrock and colluvium on undulating to steep (10-56%) land result from gentle undulating to rolling (3-32%) dolerite, sandstone and mudstone hillslopes.
